Cyber Threat Notification | Apple Patches Multiple **Vulnerabilities Affecting macOS Monterey** 

Tracker ID: TN2357 **Date:** April 04, 2023 **Category:** Vulnerability **Industry:** Technology Region: All

## **Background**

Multiple vulnerabilities in Apple macOS have been reported, potentially allowing an attacker to disclose sensitive information, circumvent security restrictions, spoof VPN servers, read or modify data, gain root privileges, execute arbitrary code, or cause denial of service conditions on the target system. These flaws occur in macOS Monterey due to memory issues, improper checks, improper input validation, curl issues, improper bound checks, privacy issues, logic issues, race condition mistakes, using an older version of Vim, and improper state management issues.

An attacker could leverage these flaws by launching a customized program. Successfully exploiting these vulnerabilities could enable the attacker to expose private information, circumvent security limitations, spoof VPN servers, access or change data, obtain root privileges, run arbitrary code, or cause a denial-of-service conditions on the target machine. Administrators must identify vulnerable Apple devices in their environments and apply the fix as soon as feasible.
